My name is Aisha Niyonsaba.

App name:	LaviPortfolio (nickname: Lavi)
Student:	Aisha Niyonsaba, final-year Software Engineering student, INES-Ruhengeri
Registration number:	2527104
Verification code:	MOB-A2-7104
Android package:	rw.ac.ines.ug2527104.laviportfolio

Concept

LaviPortfolio replaces a paper CV. It is a small Android application that introduces me, lists my skills and education, shows my projects with my own contribution, and lets me keep my profile up to date. It works offline so it can be shown in any meeting.

Intended recruiter

Recruiters, internship supervisors and innovation-challenge judges who want to understand who I am and what I can build within two minutes, on their own phone, without installing anything except one APK and without needing internet.

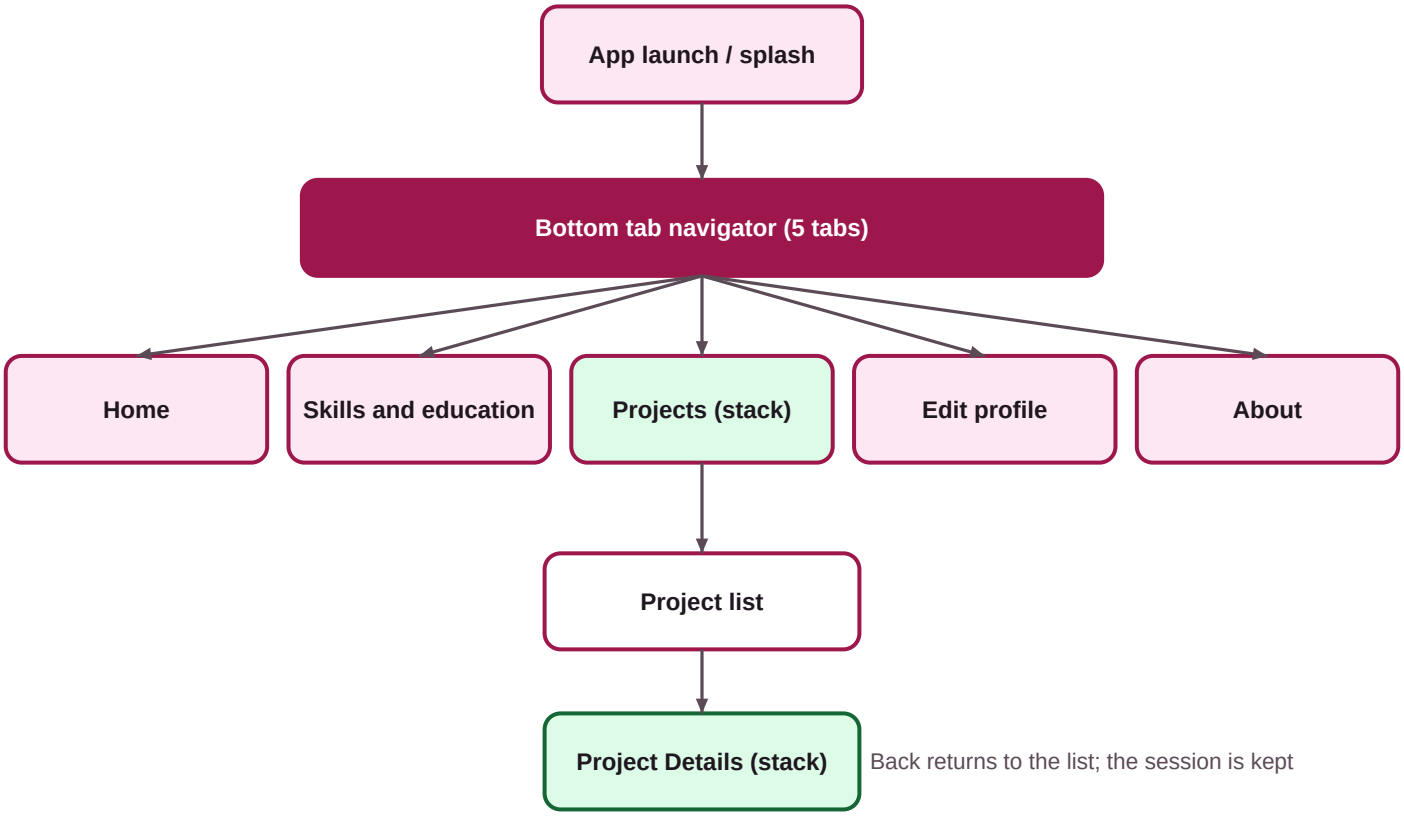
Visual direction

A warm, clear and professional look: a deep rose primary colour (#9D174D) on a soft blush background (#FFF5F8), white cards with thin rose borders, rounded corners and large readable text. My initials in a circle are used as the avatar until a photo is chosen. The same cards, chips and buttons are reused on every screen to keep the app consistent.

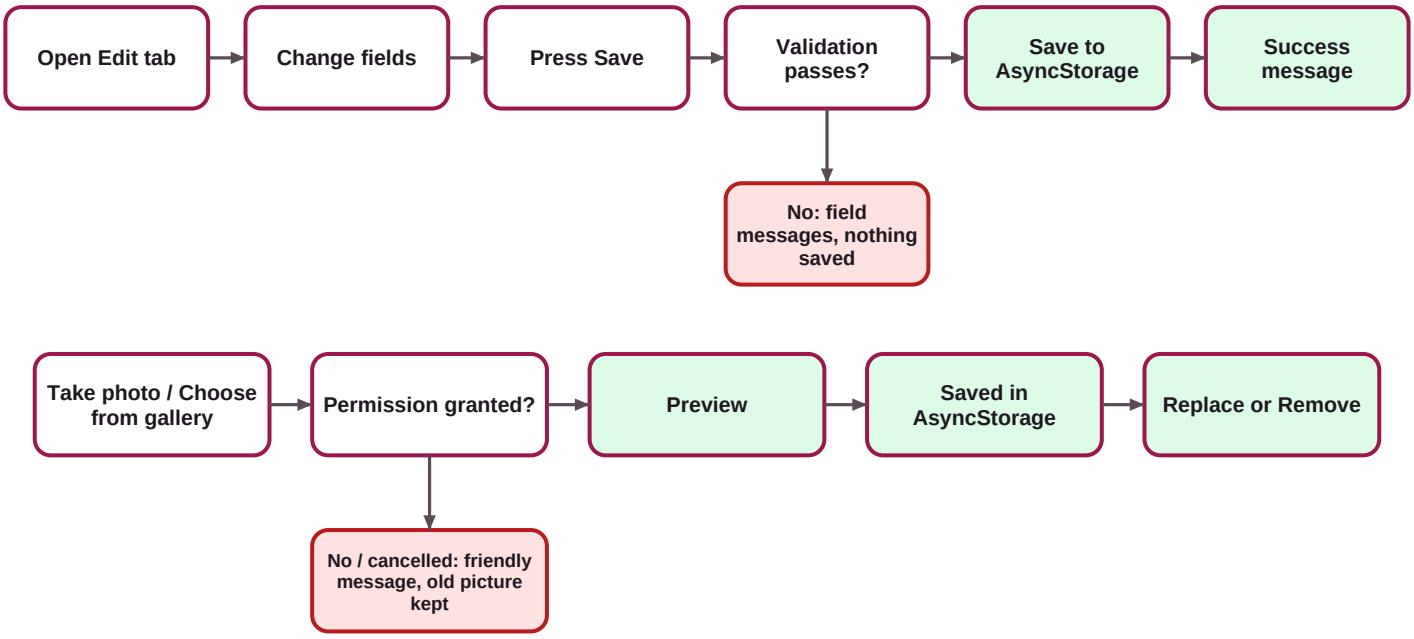
Main goals

1) Make my identity obvious on the first screen. 2) Show genuine skills and projects only. 3) Let me edit key profile fields safely with validation. 4) Keep my data on the phone only.

Information architecture: bottom tabs with a nested stack

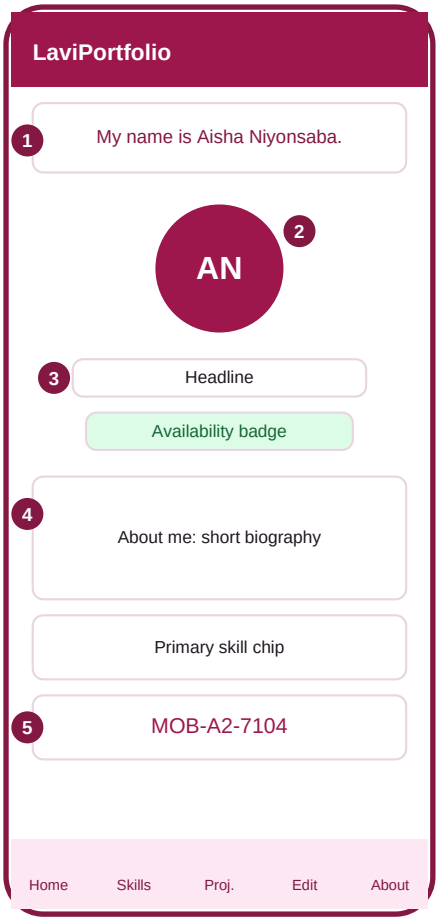


Profile editing, media selection and saved-state flow

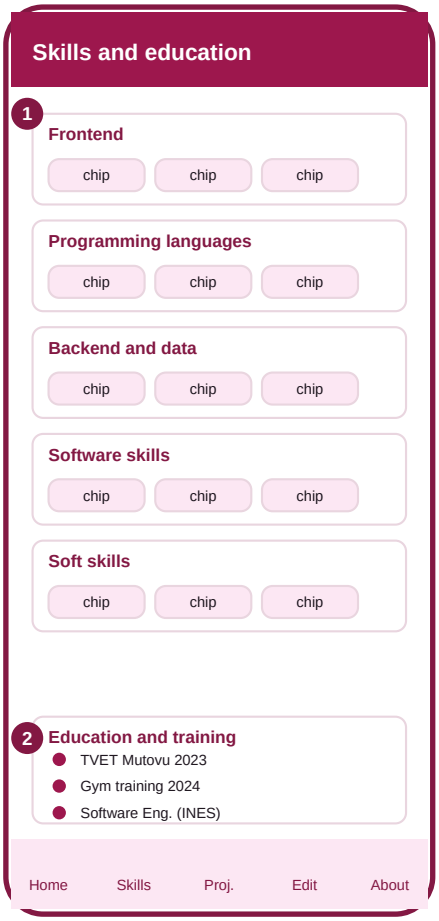


Saved-state flow

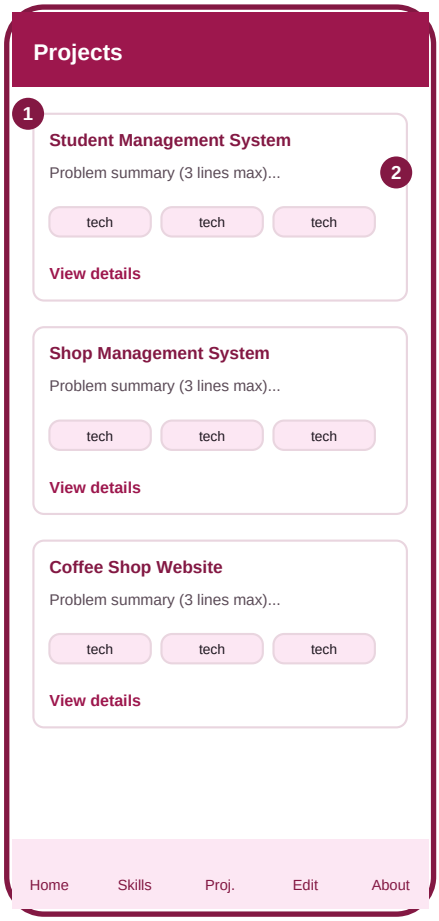
On launch the app loads the saved profile from AsyncStorage (a loading indicator is shown). If nothing is saved, default content is used. Saved changes and the selected picture reference survive closing and reopening the app. 'Reset to defaults' deletes the saved data.



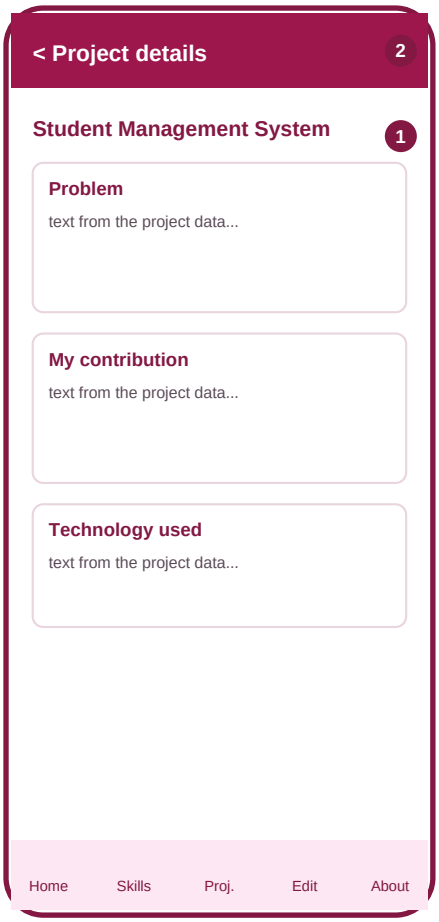
1. Exact identity sentence is the first text.
2. Avatar with initials, or the chosen photo.
3. Headline and availability come from the saved profile.
4. Biography and primary skill (editable).
5. Verification code MOB-A2-7104.



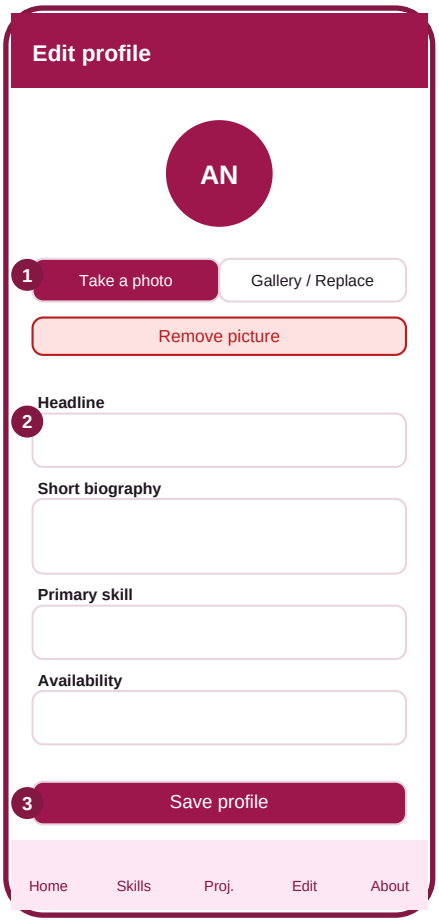
1. Five reusable skill cards with chips.
2. Education timeline: TVET Mutovu, gym training, INES Software Engineering.



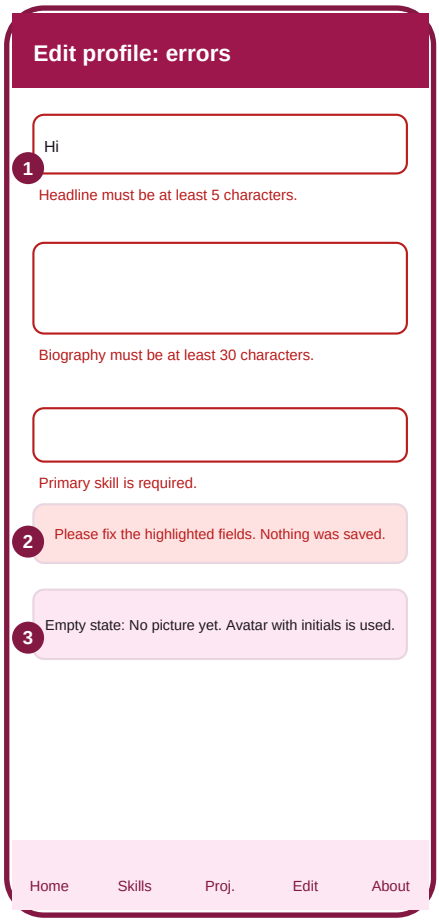
1. Reusable project cards, whole card is tappable.
2. Opens the separate Project Details screen.



1. Separate screen receiving projectId through navigation parameters.
2. Back arrow returns to the list; Android Back does the same.



1. Photo from camera or gallery, preview, replace and remove.
2. Four controlled fields.
3. Save is blocked when any rule fails.



1. Field-level error messages under each input.
2. Summary message; invalid data is never saved.
3. Empty state when there is no picture; permission-denied and cancelled messages appear in the picture card.

Validation rules

Required fields; headline 5 to 60 characters; biography 30 to 300 characters; availability up to 40 characters; primary skill 2 to 30 characters starting with a letter.

Colour choices and contrast

Primary #9D174D
White text on primary
Contrast 7.9:1

Dark rose #831843
White text on dark rose
Contrast 9.6:1

Text #1F1720
Text on background
Contrast 16.4:1

Muted #5B4B57
Muted text on white cards
Contrast 8.1:1

Danger #B91C1C
Error text on error background
Contrast 5.3:1

Success #166534
Success text on success background
Contrast 6.5:1

Typography

System sans-serif font for fast loading and offline reliability. Sizes: screen title 22 to 26 bold, card titles 18 bold, body text 16 with 24 line height, supporting hints 13 to 14. Weight and size, not only colour, show hierarchy.

Spacing and layout

A 4/8/12/16/24 spacing scale. Flexbox is used everywhere with wrapping chip rows and no fixed text heights, so content grows instead of being cut. Cards have 16 px padding and 14 px rounded corners. All screens scroll vertically so narrow phones are supported.

Accessible labels and touch targets

Buttons and tappable project cards have accessibility roles and descriptive labels (for example 'Open details of Student Management System'). Every form field has a visible label and an accessibility label. Error text is announced through a polite live region. Buttons and inputs are at least 48 px tall.

Large-text behaviour

Text scales with the Android system font size. Because layouts use flexible containers, wrapping chips and scrolling screens, larger text pushes content down instead of overlapping. Large-text testing is recorded in the test log.

Colour is never the only signal

Errors use text messages and a thicker border as well as red; success and availability use text. Tab icons always have text labels.
